

Strategy-Claim Audit Checklist

By the end, a viewer can tell whether a strategy claim is real: not whether it will make money, but whether its evidence is traceable, separated from discovery, and judged only by the authority declared before the result.

CLAIM / EXACT WORDING	SOURCE / CREATOR	DATE ENCOUNTERED
-----------------------	------------------	------------------

Use one rule: a polished chart is not a receipt. Check what was fixed before the result, which data was allowed to influence discovery, how many family-level looks occurred, and what evidence is still unburned.

Rules and gates were fixed first ☐ Can you see a preregistration made before results, hash-locked on first run, with failed or changed thresholds moved to a new program ID? DOCTRINE: F15–17	Every number has a receipt ☐ Can each number be traced to its claims receipt, with the stated timeframe matching the chart and the shown symbol matching the discussed asset? DOCTRINE: M176–180
The family had a lockbox ☐ Was a terminal holdout declared at the family’s first registration, unavailable to every program until one recorded final-judgment opening? DOCTRINE: F79–87	Seen data was burned across the family ☐ After any verdict was seen, was that window barred from confirmation for every successor? Cross-validation inside the same window does not make it unseen. DOCTRINE: F27–38
Every family look was counted ☐ Were PASS, FAIL, and sequential successor looks charged to one registered family alpha budget, with promotion refused when the budget was exhausted? DOCTRINE: F39–44, F88–91	A same-size multiplicity null existed ☐ Was the thesis tested against its same-size multiplicity null chosen from day one, rather than judged against no control after selection? DOCTRINE: F20–22
A burned PASS stayed candidate-grade ☐ Is any PASS from a previously inspected window still labeled candidate-grade, never upgraded later into deployment evidence? DOCTRINE: F92–95	Only forward evidence can authorize deployment ☐ Does the authority come exclusively from post-registration bars, with frozen thresholds and gates declared before the first qualifying bar? DOCTRINE: F92–98
Paper and live cannot change the strategy ☐ Do consumers read bars without branching on provenance, while metadata keeps lineage and TRADE_MATCH proves same-window replay identity? DOCTRINE: F99–103	The mechanism is checkable ☐ If the claim offers a market mechanism, is each link observable, stated as a mechanism rather than correlation, and confirmed by a second related asset? DOCTRINE: M91–103
The surface sells verification, never a result ☐ Does it avoid promises of alpha or performance, invented testimonials, and unverified product fields while clearly separating verification from outcome? DOCTRINE: O27–45	

STOP / UNVERIFIABLE A required receipt, lockbox, family count, or forward authority is missing.	CANDIDATE ONLY The evidence comes from discovery or a window already exposed to the family.	FORWARD-EVIDENCED A preregistered forward gate has receipts. This label still makes no performance promise.
